Introduction to Schwarz Domain Decomposition Methods

Domain Decomposition Methods

Graphics based on results from Heinlein, Perego, Rajamanickam (2022)

Historical remarks: The alternating Schwarz method is the earliest domain decomposition method (DDM), which has been invented by H. A. Schwarz and published in 1870:

 Schwarz used the algorithm to establish the existence of harmonic functions with prescribed boundary values on regions with non-smooth boundaries.

The Alternating Schwarz Algorithm

For the sake of simplicity, instead of the two-dimensional geometry,

Let us consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$

We perform an alternating Schwarz iteration:

Figure 1: Iterate (left) and error (right) in iteration 0.

Let us consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$

We perform an alternating Schwarz iteration:

Figure 1: Iterate (left) and error (right) in iteration 1.

Let us consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$

We perform an alternating Schwarz iteration:

Figure 1: Iterate (left) and error (right) in iteration 2.

Let us consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$

We perform an alternating Schwarz iteration:

Figure 1: Iterate (left) and error (right) in iteration 3.

Let us consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$

We perform an alternating Schwarz iteration:

Figure 1: Iterate (left) and error (right) in iteration 4.

Let us consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$

We perform an alternating Schwarz iteration:

Figure 1: Iterate (left) and error (right) in iteration 5.

The alternating Schwarz algorithm is **sequential** because **each local boundary value problem** depends on the solution of the **previous Dirichlet problem**:

$$(D_1) \begin{cases} -\Delta u^{n+1/2} = f \quad \text{in } \Omega'_1, \\ u^{n+1/2} = \mathbf{u}^n \quad \text{on } \partial \Omega'_1 \\ u^{n+1/2} = \mathbf{u}^n \quad \text{on } \Omega \setminus \overline{\Omega'_1} \end{cases}$$
$$(D_2) \begin{cases} -\Delta u^{n+1} = f \quad \text{in } \Omega_2, \\ u^{n+1} = \mathbf{u}^{n+1/2} \quad \text{on } \partial \Omega'_2 \\ u^{n+1} = \mathbf{u}^{n+1/2} \quad \text{on } \Omega \setminus \overline{\Omega'_2} \end{cases}$$

Idea: For all red terms, we use the values from the previous iteration. Then, the both Dirichlet problem can be solved at the same time.

The alternating Schwarz algorithm is **sequential** because **each local boundary value problem** depends on the solution of the **previous Dirichlet problem**:

$$(D_1) \begin{cases} -\Delta u^{n+1/2} = f & \text{in } \Omega'_1, \\ u^{n+1/2} = \mathbf{u}^n & \text{on } \partial \Omega'_1 \\ u^{n+1/2} = \mathbf{u}^n & \text{on } \Omega \setminus \overline{\Omega'_1} \end{cases}$$
$$(D_2) \begin{cases} -\Delta u^{n+1} = f & \text{in } \Omega_2, \\ u^{n+1} = \mathbf{u}^{n+1/2} & \text{on } \partial \Omega'_2 \\ u^{n+1} = \mathbf{u}^{n+1/2} & \text{on } \Omega \setminus \overline{\Omega'_2} \end{cases}$$

Idea: For all red terms, we **use the values from the previous iteration**. Then, the both Dirichlet problem **can be solved at the same time**.

The Parallel Schwarz Algorithm

The **parallel Schwarz algorithm** has been introduced by **Lions (1988)**. Here, we solve the local problems

Since u_1^n and u_2^n are both computed in the previous iteration, the problems can be solved independent of each other.

The Parallel Schwarz Algorithm

The **parallel Schwarz algorithm** has been introduced by **Lions (1988)**. Here, we solve the local problems

Since u_1^n and u_2^n are both computed in the previous iteration, the problems can be solved independent of each other.

This method is suitable for **parallel computing**!

Let us again consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$.

We perform a parallel Schwarz iteration:

Figure 2: Iterate (left) and error (right) in iteration 0.

Let us again consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$.

We perform a parallel Schwarz iteration:

Figure 2: Iterate (left) and error (right) in iteration 1.

Let us again consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$.

We perform a parallel Schwarz iteration:

Figure 2: Iterate (left) and error (right) in iteration 2.

Let us again consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$.

We perform a parallel Schwarz iteration:

Figure 2: Iterate (left) and error (right) in iteration 3.

Let us again consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$.

We perform a parallel Schwarz iteration:

Figure 2: Iterate (left) and error (right) in iteration 4.

Let us again consider the simple boundary value problem: Find u such that

$$-u'' = 1$$
, in $[0, 1]$, $u(0) = u(1) = 0$.

We perform a parallel Schwarz iteration:

Figure 2: Iterate (left) and error (right) in iteration 5.

We investigate the convergence of the methods (using the alternating method as an example) depending on the **size of the overlap**:

Figure 3: Error in iteration 0.

Figure 3: Error in iteration 1.

Figure 3: Error in iteration 2.

Figure 3: Error in iteration 3.

Figure 3: Error in iteration 4.

Figure 3: Error in iteration 5.

Overlap 0.05

Overlap 0.1

Figure 3: Error in iteration 5.

 \Rightarrow A larger overlap leads to faster convergence.

Solvers for Partial Different Equations

Consider a diffusion model problem:

$$-\Delta u(x) = f \quad \text{in } \Omega = [0, 1]^2,$$
$$u = 0 \quad \text{on } \partial \Omega.$$

Discretization using finite elements yields a **sparse** system of linear equations

$$Ku = f$$
.

The accuracy of the finite element solution depends on the refinement level of the mesh *h*: **higher refinement** \Rightarrow **better accuracy**.

Direct solvers

For fine meshes, solving the system using a direct solver is not feasible due to **superlinear complexity and memory cost**.

Iterative solvers

Iterative solvers are efficient for solving **sparse systems**, however, the **convergence rate depends on the spectral properties of** *K*.

Solvers for Partial Different Equations

Consider a diffusion model problem:

$$-\Delta u(x) = f \quad \text{in } \Omega = [0, 1]^2,$$
$$u = 0 \quad \text{on } \partial \Omega.$$

We solve Ku = f using the conjugate gradient (CG) method:

Solvers for Partial Different Equations

Consider a diffusion model problem:

$$-\Delta u(x) = f \quad \text{in } \Omega = [0, 1]^2,$$
$$u = 0 \quad \text{on } \partial \Omega.$$

We solve Ku = f using the conjugate gradient (CG) method:

 \Rightarrow Introduce a preconditioner $M^{-1} \approx K^{-1}$ to improve convergence:

$$\boldsymbol{M}^{-1}\boldsymbol{K}\boldsymbol{u} = \boldsymbol{M}^{-1}\boldsymbol{f}$$

Two-Level Schwarz Preconditioners

Based on an overlapping domain decomposition, we define a one-level Schwarz operator

$$\boldsymbol{M}_{\text{OS-1}}^{-1}\boldsymbol{K} = \sum_{i=1}^{N} \boldsymbol{R}_{i}^{\top}\boldsymbol{K}_{i}^{-1}\boldsymbol{R}_{i}\boldsymbol{K}_{i}$$

where \boldsymbol{R}_i and \boldsymbol{R}_i^{\top} are restriction and prolongation operators corresponding to Ω'_i , and $\mathbf{K}_i := \mathbf{R}_i \mathbf{K} \mathbf{R}_i^{\top}$.

Condition number estimate:

$$\kappa\left(\pmb{M}_{\mathsf{OS-1}}^{-1}\pmb{K}
ight)\leq C\left(1+rac{1}{\pmb{H}\delta}
ight)$$

with subdomain size H and overlap width δ .

$$\boldsymbol{M}_{\text{OS-2}}^{-1}\boldsymbol{K} = \underbrace{\boldsymbol{\Phi}\boldsymbol{K}_{0}^{-1}\boldsymbol{\Phi}^{\top}\boldsymbol{K}}_{\text{coarse level - global}} + \underbrace{\sum_{i=1}^{N}\boldsymbol{R}_{i}^{\top}\boldsymbol{K}_{i}^{-1}\boldsymbol{R}_{i}\boldsymbol{K}}_{\text{first level - local}},$$

$$\kappa\left(\boldsymbol{M}_{\mathsf{OS-2}}^{-1}\boldsymbol{K}\right) \leq C\left(1+rac{\boldsymbol{H}}{\delta}
ight)$$

A. Heinlein (TU Delft)

Two-Level Schwarz Preconditioners

Lagrangian coarse space

The two-level overlapping Schwarz operator reads

$$M_{\text{OS-2}}^{-1}K = \underbrace{\Phi K_0^{-1} \Phi^\top K}_{\text{coarse level - global}} + \underbrace{\sum_{i=1}^{N} R_i^\top K_i^{-1} R_i K}_{\text{first level - local}},$$

where Φ contains the coarse basis functions and $K_0 := \Phi^\top K \Phi$; cf., e.g., **Toselli, Widlund (2005)**. The construction of a Lagrangian coarse basis requires a coarse triangulation.

Condition number estimate:

$$\kappa\left(\boldsymbol{M}_{\mathsf{OS-2}}^{-1}\boldsymbol{K}
ight)\leq C\left(1+rac{\boldsymbol{H}}{\delta}
ight)$$

A. Heinlein (TU Delft)

Two-Level Schwarz Preconditioners

The FROSch Package – Algebraic and Parallel Schwarz Preconditioners in Trilinos

FROSch (Fast and Robust Overlapping Schwarz) Framework in Trilinos

Software

- Object-oriented C++ domain decomposition solver framework with $\rm MPI\text{-}based$ distributed memory parallelization
- Part of TRILINOS with support for both parallel linear algebra packages EPETRA and TPETRA
- Node-level parallelization and performance portability on CPU and GPU architectures through KOKKOS and KOKKOSKERNELS
- Accessible through unified $\mathrm{TRILINOS}$ solver interface $\mathrm{STRATIMIKOS}$

Methodology

- Parallel scalable multi-level Schwarz domain decomposition preconditioners
- Algebraic construction based on the parallel distributed system matrix
- Extension-based coarse spaces

Team (active)

- Filipe Cumaru (TU Delft)
- Kyrill Ho (UCologne)
- Jascha Knepper (UCologne)
- Friederike Röver (TUBAF)
- Lea Saßmannshausen (UCologne)

- Alexander Heinlein (TU Delft)

- Ichitaro Yamazaki (SNL)

Partition of Unity

The energy-minimizing extension $v_i = H_{\partial \Omega_i \to \Omega_i}(v_{i,\partial \Omega_i})$ solves

 $\begin{array}{rcl} -\Delta v_i &=& 0 & \text{ in } \Omega_i, \\ v_i &=& v_{i,\partial\Omega_i} & \text{ on } \partial\Omega_i. \end{array}$

Hence, $v_i = E_{\partial \Omega_i \to \Omega_i} (\mathbb{1}_{\partial \Omega_i}) = \mathbb{1}$.

Due to linearity of the extension operator, we have

$$\sum\nolimits_{i} \varphi_{i} = \mathbb{1}_{\partial \Omega_{i}} \Rightarrow \sum\nolimits_{i} E_{\partial \Omega_{i} \to \Omega_{i}} \left(\varphi_{i} \right) = \mathbb{1}_{\Omega_{i}}$$

Null space property

Any extension-based coarse space built from a partition of unity on the domain decomposition interface satisfies the **null space property necessary for numerical scalability**:

Algebraicity of the energy-minimizing extension

The computation of energy-minimizing extensions only requires K_{II} and $K_{I\Gamma}$, submatrices of the fully assembled matrix K_i .

 $\boldsymbol{v} = \begin{bmatrix} -\boldsymbol{K}_{II}^{-1}\boldsymbol{K}_{I\Gamma} \\ \boldsymbol{I}_{\Gamma} \end{bmatrix} \boldsymbol{v}_{\Gamma},$

A. Heinlein (TU Delft)

FROSch Construction – Graph View

In the algebraic construction of FROSCH preconditioners, we use **two different graphs**:

The node graph coincides with the simulation mesh of the computational domain:

- Graph nodes \equiv mesh nodes
- Graph edges \equiv mesh element edges

In parallel simulations:

Dual graph

The dual graph represents the connectivity of mesh elements:

- Graph nodes \equiv mesh elements
- Graph edges ≡ shared edges between mesh elements

In parallel finite element simulations, where the matrix assembly is element-based, the distribution of the data is done based on a partition of the dual graph.

A. Heinlein (TU Delft)

Overlapping domain decomposition

The overlapping subdomains are constructed by recursively adding layers of elements.

The corresponding matrices $\boldsymbol{K}_i = \boldsymbol{R}_i \boldsymbol{K} \boldsymbol{R}_i^T$

can easily be extracted from \boldsymbol{K} .

Overlapping domain decomposition

The overlapping subdomains are constructed by recursively adding layers of elements.

The corresponding matrices $K_i = R_i K R_i^T$ can easily be extracted from K.

Nonoverlapping DD

Overlap $\delta = 1h$

Overlapping domain decomposition

The overlapping subdomains are constructed by recursively adding layers of elements.

The corresponding matrices $K_i = R_i K R_i^T$

can easily be extracted from K.

Overlapping domain decomposition

The overlapping subdomains are constructed by recursively adding layers of elements.

The corresponding matrices $\boldsymbol{K}_i = \boldsymbol{R}_i \boldsymbol{K} \boldsymbol{R}_i^T$

can easily be extracted from K.

Implementation as a graph search problem

The overlapping subdomains can be seen as the result of a limited **breadth first search** on the graph representing the sparsity pattern of K.

Overlapping domain decomposition

The overlapping subdomains are constructed by recursively adding layers of elements.

The corresponding matrices $\boldsymbol{K}_{i} = \boldsymbol{R}_{i} \boldsymbol{K} \boldsymbol{R}_{i}^{T}$

can easily be extracted from K.

Some Challenging Application Problems

Monolithic (R)GDSW Preconditioners for CFD Simulations

Consider the discrete saddle point problem

$$\mathcal{A}_{X} = \begin{bmatrix} \mathbf{K} & \mathbf{B}^{\top} \\ \mathbf{B} & \mathbf{0} \end{bmatrix} \begin{bmatrix} \mathbf{u} \\ \mathbf{p} \end{bmatrix} = \begin{bmatrix} \mathbf{f} \\ \mathbf{0} \end{bmatrix} = \mathbf{6}.$$

Monolithic GDSW preconditioner

We construct a monolithic GDSW preconditioner

$$\mathcal{M}_{\mathsf{GDSW}}^{-1} = \phi \mathcal{R}_0^{-1} \phi^\top + \sum\nolimits_{i=1}^N \mathcal{R}_i^\top \overline{\mathcal{P}}_i \mathcal{R}_i^{-1} \mathcal{R}_i$$

with block matrices $\mathcal{A}_0 = \phi^\top \mathcal{A} \phi$, $\mathcal{A}_i = \mathcal{R}_i \mathcal{A} \mathcal{R}_i^\top$, local pressure projections $\overline{\mathcal{P}}_i$, and

$$\mathcal{R}_i = \begin{bmatrix} \mathcal{R}_{u,i} & \mathbf{0} \\ \mathbf{0} & \mathcal{R}_{p,i} \end{bmatrix} \quad \text{and} \quad \phi = \begin{bmatrix} \Phi_{u,u_0} & \Phi_{u,p_0} \\ \Phi_{p,u_0} & \Phi_{p,p_0} \end{bmatrix}.$$

Using \mathcal{A} to compute extensions: $\phi_I = -\mathcal{A}_{II}^{-1}\mathcal{A}_{I\Gamma}\phi_{\Gamma}$; cf. Heinlein, Hochmuth, Klawonn (2019, 2020).

Spectral Extension-Based Coarse Spaces for Schwarz Preconditioners

Highly heterogeneous problems ...

... appear in most areas of modern science and engineering:

Micro section of a dual-phase steel. Courtesy of J. Schröder.

Groundwater flow (SPE10); cf. Christie and Blunt (2001). Composition of arterial walls; taken from **O'Connell et al. (2008)**.

Spectral coarse spaces

The coarse space is **enhanced** by eigenfunctions of **local edge and face eigenvalue problems** with eigenvalues below tolerances $tol_{\mathcal{E}}$ and $tol_{\mathcal{F}}$:

$$\kappa\left(\mathbf{M}_{*}^{-1}\mathbf{K}\right) \leq C\left(1 + \frac{1}{\operatorname{tol}_{\mathcal{B}}} + \frac{1}{\operatorname{tol}_{\mathcal{F}}} + \frac{1}{\operatorname{tol}_{\mathcal{F}} \cdot \operatorname{tol}_{\mathcal{F}}}\right);$$

C does not depend on *h*, *H*, or the coefficients. OS-ACMS & adaptive GDSW (AGDSW) (Heinlein, Klawonn, Knepper, Rheinbach (2018, 2018, 2019)).

Local eigenvalue problems

Local generalized eigenvalue problems corresponding to the edges ${\mathcal E}$ and faces ${\mathcal F}$ of the domain decomposition:

$$\begin{aligned} \forall E \in \mathcal{E} : \qquad & \boldsymbol{S}_{EE} \boldsymbol{\tau}_{*,E} = \lambda_{*,E} \boldsymbol{K}_{EE} \boldsymbol{\tau}_{*,E}, \quad \forall \boldsymbol{\tau}_{*,E} \in \boldsymbol{V}_{E}, \\ \forall F \in \mathcal{F} : \qquad & \boldsymbol{S}_{FE} \boldsymbol{\tau}_{*,F} = \lambda_{*,E} \boldsymbol{K}_{FE} \boldsymbol{\tau}_{*,F}, \quad \forall \boldsymbol{\tau}_{*,F} \in \boldsymbol{V}_{F}, \end{aligned}$$

with Schur complements S_{EE} , S_{FF} with Neumann boundary conditions and submatrices K_{EE} , K_{FF} of K. We select eigenfunctions corresponding to eigenvalues below tolerances $tol_{\&}$ and $tol_{\mathcal{J}}$.

 \rightarrow The corresponding coarse basis functions are **energy-minimizing extensions** into the interior of the subdomains.

A. Heinlein (TU Delft)

Domain Decomposition for Reservoir Simulations

Algebraic multiscale coarse space

- We investigate scalable and robust simulation methods for underground hydrogen storage.
- We consider two-level domain decomposition solver with algebraic multiscale solver (AMS) coarse space; cf. Wang, Hajibeygi and Tchelepi (2014).

Layer 72 from model 2; cf. Christie and Blunt (2001).

preconditioner	its.	ĸ		
-	$> 10^{4}$	$8.61 \cdot 10^8$		
one-level	174	$1.01 \cdot 10^5$		
two-level w\ AMS	78	144.33		

Numerical results - Weak scalability for high coefficient inclusions

Numerical results - SPE10 benchmark

Learning Extension Operators Using Graph Neural Networks

Learning Extension Operators

Most coarse spaces for Schwarz preconditioners are constructed based on a characteristic functions

$$\varphi_i(\omega_j)=\delta_{ij},$$

on specifically chosen sets of nodes $\{\omega_j\}_j$. The values in the remaining nodes are then obtained by extending the values into the adjacent subdomains. Examples:

Learning Extension Operators

on specifically chosen sets of nodes $\{\omega_j\}_j$. The values in the remaining nodes are then obtained by extending the values into the adjacent subdomains. Examples:

Observation 1

Energy-minimizing extensions

• are algebraic:

 $\mathbf{v}_{l} = -\mathbf{K}_{ll}^{-1}\mathbf{K}_{l\Gamma}\mathbf{v}_{\Gamma}$

(with Dirichlet b. c.)

 can be costly: solving a problem in the interior

Heterogeneous: $\alpha_{\text{light}} = 1$; $\alpha_{\text{dark}} = 10^8$

The performance may **strongly depend on extension operator**:

coarse space	its.	ĸ
—	163	$4.06 \cdot 10^7$
Q1	138	$1.07\cdot 10^{6}$
MsFEM	24	8.05

 \rightarrow Improving efficiency & robustness via machine learning.

Prediction via Graph Convolutional Networks

Graph neural networks (GNNs) Gori, Monfardini, and Scarselli (2005) are a natural choice for learning on data defined over simulation meshes:

- Generalize CNNs LeCun (1998) to irregular, graph-structured data.
- Learn via iterative aggregation from neighboring nodes.
- Naturally permutation invariant and geometrically robust.

Further references: Scarselli et al. (2005), Bruna et al. (2014), Henaff et al. (2015), Defferrard et al. (2016), Kipf, Welling (2017), ...

Local approach

- Input: subdomain matrix K_i
- Output: basis functions {φ_j^{Ω_i}}
 on the same subdomain
- Training on subdomains with varying geometry
- Inference on unseen subdomains

A. Heinlein (TU Delft)

Theory-Inspired Design of the GNN-Based Coarse Space

Null space property

Any extension-based coarse space built from a partition of unity on the domain decomposition interface satisfies the **null space property necessary for numerical scalability**:

Explicit partition of unity

To **explicitly enforce** that the basis functions $(\varphi_j)_i$ form a partition of unity

$$\varphi_j = \frac{\hat{\varphi}_j}{\sum_k \hat{\varphi}_k},$$

where the $\hat{\varphi}_k$ are the outputs of the GNN.

Initial and target

- Initial function: partition of unity that is constant in the interior
- Target function:
 - linear on the edges
 - energy-minimizing in the interior
- $\rightarrow \mbox{ Information transport via} \\ message passing$

A. Heinlein (TU Delft)
Numerical Results for Homogeneous Laplacian – Weak Scaling Study

Model problem: 2D Laplacian model problem discretized using finite differences on a structured grid

$$-\Delta u = 1$$
 in Ω ,

$$u = 0$$
 on $\partial \Omega$,

decomposed using METIS:

 The GNN has been trained on 64 subdomains.

Numerical Results for Heterogeneous Laplacian – Weak Scaling Study

Heterogeneous Laplacian with $\alpha_{max}/\alpha_{min} = 10^3$:

 $-\nabla \cdot (\alpha(x)\nabla u(x)) = f \text{ in } \Omega = [0,1]^2, \qquad u = 0 \text{ on } \partial\Omega.$

Yamazaki, Heinlein, Rajamanickam (subm. 2024)

Graphs&Data@TUDelft

- Dates: June 17, 2025, 12.30–17.30
- Location: Crowne Plaza Hotel, Utrecht
- Lunch & networking: 12.30-13.30; closing discussion & drinks to follow.
- An afternoon with talks, case studies, and lively discussions on advancing scientific machine learning from theory to real-world deployment — tackling core challenges like uncertainty quantification, data assimilation, graph-based modelling, and operator learning.
- Confirmed plenary speakers:
 - Max Welling (UvA, CUSP AI)
 - Stefan Kurz (ETH Zürich & Bosch)
 - Koen Strien (Ignition Computing)
 - Maxim Pisarenco (ASML)
 - Jan Willem van de Meent (UvA)

CWI Research Semester Programme:

Bridging Numerical Analysis and Scientific Machine Learning: Advances and Applications

Co-organizers: Victorita Dolean (TU/e), Alexander Heinlein (TU Delft), Benjamin Sanderse (CWI), Jemima Tabbeart (TU/e), Tristan van Leeuwen (CWI)

- Autumn School (October 27–31, 2025):
 - Chris Budd (University of Bath)
 - Ben Moseley (Imperial College London)
 - Gabriele Steidl (Technische Universität Berlin)
 - Andrew Stuart (California Institute of Technology)
 - Andrea Walther (Humboldt-Universität zu Berlin)
 - Ricardo Baptista (University of Toronto)
- Workshop (December 1–3, 2025):
 - 3 days with plenary talks (academia & industry) and an industry panel
 - Confirmed plenary speakers:
 - Marta d'Elia (Atomic Machines)
 - Benjamin Peherstorfer (New York University)
 - Andreas Roskopf (Fraunhofer Institute)

Join us for inspiring talks, hands-on sessions, and industry collaboration!

FROSch (Fast and Robust Overlapping Schwarz)

- FROSCH is based on the Schwarz framework and energy-minimizing coarse spaces, which provide numerical scalability using only algebraic information for a variety of applications
- $\rm FROSch$ is well-integrated into the $\rm TRILINOS$ software framework, enabling
 - large-scale distributed memory parallelization and
 - node-level performance on CPU and/or GPU architectures

Learning extension operators

- Extensions are a major component in the construction of coarse spaces for domain decomposition methods.
- Using GNNs and known properties from the theory, we can learn extension operators that lead to a scalable coarse spaces.
